WavWriter Console

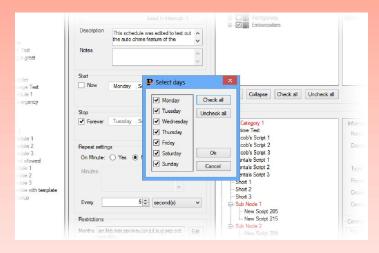

for Penta's WavWriter PA/VMS Management

MAP-BASED SELECTION

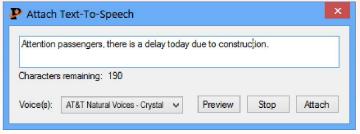

Penta Corporation is pleased to announce its new map-based graphical user interface (GUI) control console application for its WavWriter Public Address and Visual Message Sign management Suite.

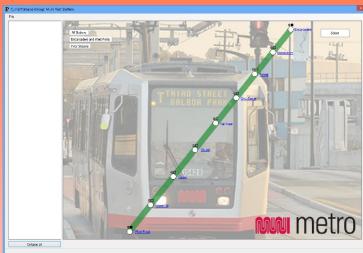

The map-based GUI provides users with the ability to select zones, stations, groups of stations or all stations through the use of an intuitive map representation of the transit authority's actual rail map.

MESSAGE SCHEDULING

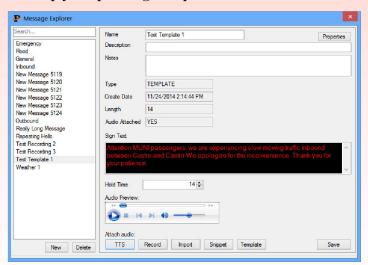

Whether created ad-hoc, pre-recorded or by the 'text-to-speech' window, messages are easily queued for one time or regular playback, with built-in priority scheduling.

SIGN AND AUDIO MESSAGING

In addition to station and zone selection, the Penta PA/VMS control console provides the users with remote alarm management, voice and visual message control, and the ability to make live, pre-recorded, and scheduled announcements anywhere in the system. Using networking and communication standard TCP/IP protocols, Penta's software applications provide the ease of use, thorough control, and remote diagnostic information needed to keep your passengers up to date.
